

FixFlow Ads — End-to-End Narrative Walkthrough

Created: 2026-04-27 **Audience:** Non-technical readers (executives, sales, partner shops) **Purpose:** Walk through the entire ads system as a story so non-engineers understand the workflow, who does what, and how money flows.

The Cast

Three characters carry the story:

- Sarah** — owns *Quick Fix Phone Repair* in Manila. Just signed up to FixFlow.
- Marcus** — works on FixFlow's ads team at HQ.
- Emma** — random person scrolling Facebook on her lunch break, has a cracked iPhone.

Chapter 1 — Sarah signs up

Sarah hears about FixFlow from a friend. She visits FixFlow.ai, signs up her shop, fills in her business info, hours, services, prices. **She pays \$500/month** for the FixFlow software (this is the existing subscription).

Now she has a FixFlow shop dashboard. She can manage bookings, message customers, and run her business through the app.

💰 **At this point: FixFlow earns \$500/month from Sarah. No ads yet.**

Chapter 2 — Sarah opts into ads

A few weeks in, FixFlow shows Sarah an offer in her dashboard:

"Want more customers? Let FixFlow run ads for your shop. We'll handle Facebook, Instagram, and Google. You'll only pay when we bring you bookings."

Sarah clicks **Yes**. She picks one of three plans:

Plan	How it works
A	Sarah pays \$100/day in ad spend directly to Facebook/Google. FixFlow charges \$299/month for the dashboard service.
B	Sarah pays FixFlow \$120/day flat. FixFlow uses \$100 for ads, keeps \$20 as their cut. <i>(FixFlow's preferred plan.)</i>
C	Pay-per-result. FixFlow runs ads at their own risk; Sarah pays \$50 per confirmed booking (or 10% of revenue from those bookings).

Sarah picks **Plan B** — \$120/day to FixFlow. Simplest for her.

💰 **At this point: FixFlow earns \$20/day margin from Sarah on top of the \$500/month software fee.**

Chapter 3 — Marcus creates the campaign

Over at FixFlow HQ, Marcus opens the **Admin Ads Control Center**. He sees Sarah's request and gets to work:

1. Picks a service from Sarah's catalog: *iPhone Screen Repair — \$80, 30 minutes*
2. Picks an ad template from FixFlow's library: *"Cracked screen? We fix it today."*
3. Sets the budget: \$100/day
4. Targets: people within 10 miles of Sarah's shop in Manila who searched for phone repair recently
5. Clicks **Launch**

The ad goes live on Facebook and Instagram, **paid for by FixFlow's ad account**. Marcus does this exact same process for 50 other shops the same morning.

 **Key insight:** Sarah never opens Facebook Ads Manager. Sarah doesn't have to write copy. Sarah doesn't even know what AdSet means. **That's the whole point.**

Chapter 4 — Emma sees the ad

Emma is on Facebook, lunch break, broken iPhone. She sees:

 *"Cracked iPhone screen? Quick Fix Phone Repair in Manila — same-day repair from \$80. Tap to chat."*

She taps **Send Message**. Facebook opens Messenger, Emma writes: *"How much for an iPhone 13 screen?"*

This is the critical moment. Emma's message **does not go to Sarah's personal phone**. It goes through Facebook to **FixFlow's system**. FixFlow records:

- A new lead in `ad_leads` — Emma's name, phone, the campaign she came from
 - A new conversation thread in FixFlow's messaging system
 - Emma's lead status: **"New"**
-

Chapter 5 — AI assistant takes over

Within 2 seconds, the AI assistant replies as if it were Sarah's shop:

"Hi! Thanks for reaching out to Quick Fix Phone Repair. iPhone 13 screen repair is \$85, takes about 30 minutes, and we can do it same-day. We're at 4416 Roxas Blvd, open until 7pm tonight. Want to book a slot?"

Emma: *"Yes, can I come at 4pm?"*

AI: *"4pm works. I'll need a \$20 deposit to hold the slot — refundable if you cancel 2 hours ahead. Tap here to pay: [link]"*

Emma pays the \$20 deposit through FixFlow's payment flow. The AI confirms:

"Booked! See you at 4pm. Your repair will be \$85 total — \$20 already paid, \$65 due at the shop. Confirmation #: BK-9F2A12."

Lead status: New → Contacted → Booked → Paid (deposit)

This entire conversation happened in **45 seconds** while Sarah was working on another customer. Sarah's only notification is a push: *"New booking from ad — Emma at 4pm — \$85."*

Chapter 6 — Emma shows up

4pm. Emma walks into Sarah's shop. Sarah opens FixFlow on her tablet, sees the booking, sees the \$20 deposit already received. She fixes Emma's screen in 25 minutes. Emma pays the remaining \$65 at the counter.

Sarah taps **Mark Complete** in FixFlow.

Lead status: Paid → Completed ✓

Chapter 7 — The money flow (this is the key part)

Every dollar tracked:

Who paid	Who received	Amount	What for
Emma	FixFlow (held in escrow)	\$20	Deposit
Emma	Sarah (cash at shop)	\$65	Remaining repair fee
FixFlow	Sarah	\$20	Released deposit (transferred to Sarah after job complete)
Sarah	FixFlow	\$120	Daily ads fee (Plan B)
FixFlow	Facebook	\$100	Ad spend
Sarah	FixFlow	\$500/30 ≈ \$16.67	Daily share of monthly software subscription

On this single ad day, FixFlow's earnings from Sarah:

- \$20 margin from ads (\$120 in - \$100 to Facebook)
- \$16.67 daily share of software subscription
- **Total: \$36.67/day from Sarah**

Emma paid \$85 total (\$20 deposit + \$65 cash). All \$85 ends up with Sarah. FixFlow doesn't take a commission on Emma's transaction itself — they make money on Sarah, not on Emma.

Chapter 8 — The dashboards tell the story

Sarah's view (Shop Dashboard, end of day)

Quick Fix Phone Repair — Today

Metric	Value
 Spent on ads	\$100 (paid to FixFlow \$120, FixFlow keeps \$20 margin)
 Leads	14
 Bookings	5
 Revenue from ads	\$510 (Emma's \$85 + four others)

ROI

5.1× your money back

Lead pipeline: 14 new → 9 contacted → 5 booked → 4 paid → 3 completed → 2 lost (didn't reply)

Sarah sees clearly: she paid FixFlow \$120, got back \$510. She's making \$390 in profit per ad day. **She's never going to cancel this service.**

Marcus's view (Admin Ads Control Center)

FixFlow Ads — Today (across 50 shops)

Metric	Value
💰 Total ad spend	\$5,000
💵 Total revenue charged to shops	\$6,000
💛 FixFlow margin	\$1,000 (Plan B shops only)
📈 Top performing campaigns	shop #34 (iRepair Mission), shop #12 (Sarah)
⚠️ Underperforming	shop #21 (low CTR, needs new creative)

Marcus can pause low-performers, double down on winners, swap creative — making sure shops keep seeing positive ROI so they don't churn.

Chapter 9 — One month in, the math for FixFlow

If Sarah runs ads for 30 days at \$120/day:

FixFlow revenue from Sarah, monthly	Amount
Software subscription	\$500
Ad margin (Plan B, \$20/day × 30)	\$600
Total from one shop, one month	\$1,100

If FixFlow has **1,000 shops** with the same setup:

\$1,100,000 / month ≈ \$13.2M / year

Of that:

- **\$600K/month is ad margin** (scales with how much shops spend)
- **\$500K/month is software subscriptions** (scales with how many shops)

The ad margin is the new growth engine. It can grow even without adding new shops — just by helping existing shops spend more profitably.

Chapter 10 — Why this is structurally smart

Three reasons this is a great business model:

1. The shop becomes dependent (in a good way)

Sarah was paying \$500/month for software (could potentially churn for a competitor). Now she's getting \$390/day in profit from FixFlow's ads. **She's not going anywhere** — she'd have to rebuild the whole pipeline elsewhere.

2. FixFlow scales with the shop's success

Bigger shops spend more on ads → bigger margin for FixFlow. **We win when our customers win.** Aligned incentives.

3. The AI is the moat

Sarah could, in theory, hire a marketing agency. But no agency has:

- An AI assistant talking to leads in 2 seconds
- 24/7 availability
- Knowledge of the shop's services, prices, and calendar
- The booking + deposit + payment flow already wired up

The AI is what reliably turns *leads* into *bookings*. **No other competitor has this combination.**

Chapter 11 — How the rollout phases match this story

Spec Phase	What's manual vs automated in the story
Phase 1 — Manual Dashboard	Marcus manually types in "we spent \$100 today, got 14 leads, 5 bookings, \$510 revenue." ROI math works. Sarah sees her dashboard.
Phase 2 — Lead Tracking	Every lead automatically saved with status pipeline. Manual data entry for ad spend continues.
Phase 3 — AI Agent	The AI conversation in Chapter 5 becomes real. Replaces "shop manually replies to every lead."
Phase 4 — Meta API	Lead capture, ad spend, and performance numbers automatically pull from Facebook. No more manual entry.
Phase 5 — Multi-Industry	Same flow works for gyms, salons, plumbers, lawyers. Same engine, different shop types.

 **Key insight:** Sarah's experience **never really changes** between phases. What changes is how much manual work the FixFlow team does behind the scenes. Phase 1 — Marcus enters everything by hand. Phase 5 — the system runs itself.

Chapter 12 — TL;DR in one sentence

FixFlow runs ads on Facebook/Google for shops, captures every customer who responds, has an AI assistant book them automatically, and shows the shop they got 5× their money back — and FixFlow earns from a \$500/month software fee plus a margin on the ad spend they manage.

Quick reference — Where things happen

Activity	Where it lives
----------	----------------

The ad itself (image, headline)	Facebook, Instagram, Google, TikTok (external)
Where customer first sees the ad	Their social feed (external)
The click	External, then redirects
Conversation with AI	Inside FixFlow
Lead capture, status tracking	Inside FixFlow
Booking creation	Inside FixFlow
Deposit payment	Inside FixFlow (via Stripe)
Final payment in store	Cash/card, in person
ROI calculation	Inside FixFlow
Sarah's dashboard	Inside FixFlow
Admin's Ads Control Center	Inside FixFlow

FixFlow is the command center. Facebook is the megaphone. The AI is the salesperson. The shop is the workshop.

Where the revenue comes from (recap)

Revenue stream	Charged to	When	How calculated
Software subscription	Shop	Monthly	Flat \$500
Ad margin (Plan B)	Shop	Daily	Charged amount minus actual ad spend
Performance fee (Plan C)	Shop	Per booking	\$50/booking OR % of revenue
Ad spend pass-through (Plan A)	Shop	Daily	None — shop pays Facebook directly, FixFlow charges \$299/mo for the dashboard

FixFlow does not take a cut of the customer's transaction. Emma pays Sarah \$85; all of it ends up with Sarah. FixFlow's revenue comes entirely from the shop side.

Open questions still being decided

(Cross-reference: see [review-fixflow-ads-system-spec.md](#) §6 for the full list)

The story above assumes some choices that still need exec sign-off:

- Which billing model is the **default pitch** to new shops? (B is shown in this story, but A and C are still on the table.)
- How does the existing \$500/month subscription mesh with Plan A's \$299/month? (Are they additive, replacement, or tier upgrade?)
- When a booking gets refunded, does the day's reported ROI update retroactively?

- Who reviews ad creative for compliance — FixFlow or auto-approve?

Once those are decided, the numbers and policies in this narrative become product reality.
